

SHUZI RESEARCH

BioMeridian is the world's largest manufacturer of FDA-registered Meridian Stress Assessment instrumentation, medical diagnostic equipment used by doctors and health practitioners around the world to assess functional health.

The BioMeridian MSA-21 measures stress in up to 60 different parts of the human body. It is currently used by over 1500 physicians in the United States and in countries around the world to measure resistance to stress in essential bio-systems throughout the body.

Subjects were tested in each of the 60 areas of the human biofield and measured on a data output scale of 0 to 100. The ideal target zone falls within the score range of 45 to 55, while any measurement above 55 indicates the presence of stress, as it denotes excess energy, or an inflamed condition in that part of the biofield. Any measurement below 45 is also a sign of stress, because lower numbers indicate that the energy systems are impaired, weakened or blocked. The closer the measurements are to 50, the closer the subject is to being in his ideal performance zone, making him better able to cope with the effects of stress.

Subjects were first tested without Shuzi, at which point each stress score was recorded. Afterward, each subject was tested wearing Shuzi, and scores were again recorded, showing a very notable positive difference between the first and second test in nine out of 10 subjects.

BioMeridian's testing scientifically demonstrated the immediate efficacy of Shuzi's Nano Vibrational Technology and its ability to lower stress levels in the human body, as well as balance the biofield.

More advanced tests require measurement equipment Hand Dynamometer - Grip Meter Test

Do not wear or have the Shuzi bracelet within 12 inches of testing subject.

Reset second hand on dynamometer.

Grip as hard as possible to get maximum reading (the second hand will mark the maximum strength).

Wear the Shuzi product and repeat Step 3. Check the maximum level. It should increase by 10%-30%.

Steps 1-4 may be repeated for verification.

INTENTION HEALTH RESEARCH STUDY TO TEST THE EFFECTIVENESS OF WEARING A SHUZI BRACELET

Live Blood Cell Analysis Darkfield Microscopy Blood Tests

Darkfield Microscopy blood tests were done on four different test subjects to assess the effects of wearing a Shuzi bracelet.

The first test was before the subject had worn a Shuzi. The second test was done after the subjects had worn a Shuzi for half an hour. The third test was done, for two subjects, after they had worn a Shuzi for three weeks, and for the other two subjects, after they had worn a Shuzi for six days.

On the first test all four, being quite healthy people, did not show some of the signs of deterioration in the blood that are commonly seen. However, there was some proliferation of the sub-cellular entities in the blood that are detailed in the work of Canadian scientist Gaston Naessens and German scientist Gunther Enderlein. The following website will give details and diagrams of the somatid cycle as described by Naessens

<http://www.hbci.com/~wenonah/new/somatid.htm>

In each case, the first test showed the red blood cells to be in a fairly normal condition, not suffering from rouleaux (clumping). However there were signs of deterioration of the health of some of the individuals shown by the advanced stage of somatids discovered in the samples. Looking at the blood again three hours later showed significant deterioration with many advanced somatid entities. (The blood is stressed after being extracted from the body, aging and deteriorating on the slide and shows what could likely happen in the body under stressful conditions. In other words, it is an early warning sign that health-related problems could develop if lifestyle issues are not changed.)

In the second test, done only one half hour after wearing a Shuzi bracelet, the blood already looked healthier, with fewer advanced somatid stages. Three hours later, the blood had experienced significantly less deterioration than in the first test.

In the third test, done six days (two subjects) or three weeks later (two subjects), the samples taken looked healthier in all cases. The two subjects who had previously shown "ghost cells" (depleted red cells), displayed a remarkable improvement in this area. There was also a change in showing less detritus in the samples. The most impressive part, however, came in looking at the blood five hours later. Many of the red cells still looked amazingly healthy while some were starting to dehydrate and shrivel, but there was an extreme difference in the somatid cycle seen. There were little to none of the advanced stages of the somatid cycle seen, even though the conditions were very stressful by this time.

All the test subjects reported noticeable beneficial changes in their well-being, including attitude, energy, emotions, physical appearance (remarked upon by friends) and stress level.

Obviously, the Shuzi bracelet had created a very beneficial effect on the health of the subjects overall and was protecting them from the effects of various stresses in their lives, or enhancing their resistance to these stresses.

Information Regarding the Trainer for Life Blood Analysis:

Michael Coyle is a Nutritionally-Oriented Natural Therapist and Microbiological Researcher. In 1967, at the age of 17, Michael began his experimentations with dietary approaches to healing, following the works of the developer of Macrobiotics, George Osawa. This led him to make a synthesis of both Oriental approaches and Western Naturopathic approaches as described by Dr. Paavo Airola, ND.

Michael has been applying and researching complementary healing modalities for more than 30 years. He has also worked extensively with herbal, homeopathic, isopathic, nutritional, nootropic and energetic therapies
