Recent statistics have good news for us. Centenarians are the fastest growing age group in America. What’s the secret to a long and healthy life? And, what can you do right now to ensure that you will one day take your place in the ranks of vibrant 100 year olds?

The answer can very well be found in the presence of a small but potent molecule made in every cell of your body called Glutathione. While Glutathione may not have the same notoriety as other more high profile nutrients such as vitamin C and E, it certainly is a miracle molecule.

Glutathione levels of 41 centenarians between the ages of 100-105 years old were compared with those people between 60-79 years old. They found that the mean Glutathione activity was significantly higher in centenarians than in the group of younger elderly subjects, and that centenarians with the best functional capacity tended to have the highest Glutathione activity.

The study concluded that that high Glutathione levels are associated with increased survival.

In a later study, Glutathione levels were evaluated in 87 women in excellent physical and mental health, ranging in age from 60 to 103. The scientists found that all women had very high blood Glutathione levels. They followed these women for five years, and concluded “high blood Glutathione concentrations … are characteristic of long-lived women.”

**The Life-Extending Master Antioxidant**

Glutathione (GSH) is a tripeptide molecule composed of three amino acids: glutamic acid, cysteine and glycine. It is one of the main nonprotein antioxidants that exists within each cell, and has been referred to as the body’s “master antioxidant.” It rules the body’s cells and is abundant in cytoplasm, nuclei and the mitochondria.

Although discovered in 1888, the initial research on Glutathione deficiency was conducted in the 1920’s and 1930’s and concentrated on the eye, particularly the lens. It is well known that macula degeneration is related to low levels of Glutathione. By the 1980’s, researchers realized that Glutathione was a major player in all aspects of good health and disease prevention.

Without adequate Glutathione levels, each cell would eventually disintegrate from massive free radical damage, your body would have little resistance to metabolic waste products, and your liver would be severely compromised from the eventual accumulation of toxins. Our cells would also be defenseless against the many bacteria, viruses and many of the carcinogens that pose a health threat.
For the past three decades, researchers have been investigating the role of antioxidants for the maintenance of good health as well as for the prevention and treatment of oxidative stress-induced diseases.

While the better-known antioxidants such as vitamin A, vitamin E and selenium must be obtained from the diet. Glutathione is considered the master antioxidant because all other antioxidants depend upon the presence of Glutathione to function properly. For example, it is essential in regenerating oxidized forms of vitamins C and E by re--circuiting them back into antioxidant function. Normally once these antioxidant vitamins scavenge free radicals, they can become oxidized themselves and attack the healthy cells. This is known as pro-oxidation. Glutathione easily restores them to their reduced form so they can resume the free radical scavenging activity again.

When the Glutathione systems are functioning effectively, the use of antioxidants maximizes their effectiveness in the treatment and prevention of degenerative diseases associated with oxidative stress. This includes arthritis, cancer, cardiovascular diseases, diabetes and macular degeneration.

Glutathione performs important jobs in the body which includes protecting cells against the destructive effects of free radicals; detoxifying external substances such as drugs, environmental pollutants and carcinogens; maintaining cell membrane stability; regulating protein and DNA biosynthesis and cell growth; enhancing immunologic function through its influence on lymphocytes; prostaglandin synthesis; and amino acid transport.

Since it is involved in so many critical functions, Glutathione impacts all levels of the body’s physiological functioning.

It is believed that Glutathione has the potential to treat and prevent hundreds of diseases. When you consider the role that Glutathione plays in the basic wellness of cells, the primary living building blocks in our body, you can appreciate why maintaining Glutathione levels is critical for optimal wellbeing.

*Essential Support of Immunity and Detoxification*

In addition to its role as a powerful antioxidant, Glutathione also serves as an immune system enhancer and a detoxifier.

As an immune system enhancer, Glutathione is needed for the proper functioning, and in particular the creation and maintenance, of T-cells a type of lymphocytes, the body’s front-line defense against infection.

Glutathione plays a central role in the proper function of the white blood cells. Dr. Gustavo Bonus, a Glutathione expert, says, 'The limiting factor in the proper activity of our lymphocytes (the white blood cells) is the availability of Glutathione.' The healthy growth and activity of the white blood cells depends upon high levels of intracellular Glutathione.
In people with immune deficiency, Glutathione levels fall well below the normal levels in blood and immune cells. Restoring Glutathione levels to those found in healthy people has benefited immune deficient patients. Studies have suggested that an increase in the Glutathione level in the body can help patients with HIV (AIDS) to improve their survival.

In a toxic world, survival literally depends on the body’s ability to adequately detoxify the tens of thousands of chemicals that are inhaled, ingested, and absorbed into the body. Glutathione also comes to our rescue as a major detoxifier. The level of Glutathione in the liver is critically linked to the liver's capacity to detoxify. This means that the higher the Glutathione content, the greater the liver's capacity to detoxify harmful chemicals.

Glutathione is able to bind to organic toxins, as well as heavy metals, solvents and pesticides, and transform them into a form that can be safely excreted in urine or bile.

**Glutathione’s Role in Cancer Prevention**

Columbia University School of Public Health, estimated that 95 percent of cancer is caused by diet and environmental toxicity. It is evident that in order to prevent cancer, it is imperative to protect the body from this onslaught of toxins.

Dr. Dean Jones PhD, Director of Nutritional Health Sciences at Emory University and Glutathione expert states “ The role of Glutathione that has probably received the most attention in the past 50 years is the function of Glutathione as an anti-carcinogen. Glutathione is used to counter reactive chemicals that would otherwise cause mutations in the DNA and cause cancer. A little over 50 years ago it was recognized that many chemicals we are exposed to are activated in the body to reactive chemicals, the most central way that the body gets rid of these is by reacting these with Glutathione. Glutathione is the most anti-carcinogenic chemical we have in our body.”

Most people do not inherit "cancer genes" rather; they have a genetic weakness in their detoxification system. Glutathione is an extremely important part of the detoxification system, and, thus, one of our primary defenses against cancer.

**The Miracle Molecule**

As a powerful free radical scavenger, immune enhancer and detoxifier, Glutathione has shown to be effective in the following conditions; autism, cardiovascular disease, autoimmune diseases, asthma, diabetes, lung disease, Parkinson’s’ disease, gastrointestinal inflammation and Crohn’s disease, hepatitis, chronic fatigue syndrome, HIV-AIDS, neuro-degenerative diseases such as MS (Multiple Sclerosis), ALS (Lou Gehrig’s Disease), Alzheimer’s and Parkinson’s and degenerative eye conditions such as cataracts and macular degeneration.
Medical science is still ascertaining all the critical roles played by Glutathione in disease resistance and general good health.

Staying healthy as well as recovering one’s health requires maintaining high levels of Glutathione. The older we get the more our levels of Glutathione decline, especially after the age of 45. Therefore, shoring up your Glutathione reserves is crucial.

Who needs to increase Glutathione levels? If you have been diagnosed with a chronic illness, are in pain, have autism, are under stress, have digestive problems, have a weakened immune system, eat lots processed foods, engage in strenuous exercise, are overweight and feel fatigued, Glutathione will be a real boost to your wellbeing.

And if you are committed to staying healthy and energetic, then a successful anti-aging program necessitates maintaining high Glutathione levels.

**Increasing Glutathione Levels**

The very best way to ensure adequate Glutathione levels is to provide the body with the key building blocks of Glutathione.

A clinically proven product that increases intracellular Glutathione is called MaxGXL developed by Robert Keller MD, MS, FACP, a renowned cancer and AIDS researcher and clinician specializing in the fields of Internal Medicine, Immunology and Hematology. Dr. Keller has also been named as one of the world's 2,000 Outstanding Scientists of the 21st Century, and has served on the scientific review panels for the National Institutes of Health and the Veterans Affairs.

MaxGXL provides the required nutrients needed to promote the body’s own ability to manufacture and absorb Glutathione. After years of research and development, Dr. Keller created MaxGXL, a product containing the necessary components of Glutathione that, when absorbed into the body, stimulate the body’s own production of Glutathione in every cell of the body. MaxGXL also aids in liver support, thus helping the liver to function as the main production site and storehouse for Glutathione.

Since Glutathione levels are lowest in the mornings, it is best to use all Glutathione supplements early in the day.

Glutathione levels can also be increased in several other ways. Moderate, prolonged physical exercise increases Glutathione and its related enzyme levels in the blood and skeletal muscles.
In addition, many vitamins and nutritional supplements are Glutathione boosters: lipoic acid, pines bark extract (pycnogenol), melatonin, bilberry, grape extract, vitamin C, whey protein, and turmeric have all been shown to elevate Glutathione.

Glutathione is found primarily in fresh whole foods: raw fruits and vegetables, raw meats and fresh milk (unfortunately even milk storage reduces the Glutathione level). Some of the foods that are high in Glutathione include cruciferous vegetables, such as cauliflower, broccoli, cabbage, kale, and Brussels sprouts. But don’t expect to find any Glutathione in a junk food diet. It is non-existent in cereals, canned and processed foods, and cured meats.

While Glutathione has a very long list of impressive benefits, its fundamental role is to improve, if not maximize, the function of every cell in every organ of your body. There are very few other factors, which are as predictive of our life expectancy as well as our levels of cellular Glutathione.

So if you really want to be around to celebrate your 100th birthday, there’s no time like the present to start revving up those Glutathione levels!
