Reverse Osmosis / Activated Carbon Drinking Water Appliance

System tested and certified by NSF International against ANSI/NSF Standard 58 and against ANSI/NSF Standard 42 for the reduction of the contaminants listed below.

The concentration of the indicated substances in water entering the system was reduced to a concentration less than or equal to the permissible limit for water leaving the system as specified in ANSI/NSF 58.

Test Parameters: pH = 7.5 +/- 0.5. Flow = 0.6 gpm(2.3 lpm). Pressure = 50 psi(345kPa). Temp = 68° +/-5° F(20° +/-5°C). TDS = 200-500 mg/L². Turbidity = 1 NTU

1) Barium, Cadmium and Chromium were tested at 750 mg/L TDS.

2) The reduction of Radium was verified by using Barium as a surrogate under NSF protocol, therefore average percent rejection for Radium is <99%.

Caution	
Do not use with water that is microbiologically unsafe or of unknown quality without adequate disinfection before or after the unit.	
Systems claiming cyst reduction may be used on disinfected waters that may contain filterable cysts.	

Note that while the testing was performed under standard laboratory conditions, actual performance may vary.

This system shall be used only for arsenic reduction on chlorinated water supplies containing detectable residual free chlorine at the system inlet.

It is essential that operational, maintenance and filter replacement requirements be carried out for this product to perform as advertised. Change carbon cartridges every 6 months. Flush new cartridge for 2 minutes.

Important Quality Assurance Requirements

These Reverse Osmosis Drinking Water Appliances contain treatment components that are critical for effective reduction of Total Dissolved Solids as well as inorganic contaminants. We strongly recommend that the user test the water a minimum of every 6 months to verify that the appliance is performing satisfactorily. A built in Percent Rejection (PR) water quality monitor is available* to provide the user with a means to test the water at any time, or your dealer may offer a semi-annual testing service.

* as an option at additional cost

Routine Maintenance

Sediment Prefilter and Carbon Postfilter:

Change at a minimum of six months depending on feed water quality.

Membrane: Change as required based on periodic TDS rejection tests or an on-site monitor (PR). The maximum recommended service life is 36 months. If a Percent Rejection (PR) Monitor is not used, then your dealer may offer a semi-annual testing service.

Warranty

Entire System: **10 years**

R. O. Membrane: **2 years**
Service life of membrane varies with local water conditions.
